About Me

Third-year Computer Science student at El-Shrouk Academy seeking a DevOps internship opportunity. Skilled in Ubuntu administration, Bash scripting, Docker containerization, CI/CD pipelines, Git, and networking fundamentals — all applied in real lab and project environments. Completed two government-certified DevOps and Cloud training programs scoring 97%, gaining practical experience with AWS, VMware, and MySQL. Looking to contribute to engineering teams by supporting infrastructure maintenance, deployment pipelines, and service monitoring.

Education

Bachelor of Science in Computer Science *Sep. 2023 – Jun. 2027*

El-Shorouk Academy, Cairo, Egypt | Grade: C+

- Volunteer Cloud Instructor, IEEE Shrouk Academy Student Branch — delivered cloud fundamentals sessions to fellow students.

Skills

DevOps & Automation: Docker, CI/CD Pipelines, GitHub Actions, Bash Scripting, Git, Automated Deployment, Service Monitoring

Operating Systems: Ubuntu, Linux, Windows Server, Hyper-V, VMware

Cloud: AWS (EC2, S3, VPC, IAM, CloudFront), 3-Tier Architecture, Containerization

Backend Development: C#, ASP.NET Core, Web APIs, Entity Framework Core, SQL Server, MySQL, OOP, Design Patterns

Networking: Networking Fundamentals, DNS/DHCP, VLANs, ACLs, Firewall Configuration, VPN, OSPF, EIGRP

Soft Skills: Team Collaboration, Quick to Learn New Tools and Technologies, Problem Solving, Attention to Detail, Time Management, Technical Communication, Adaptability, Performs Well Under Deadlines

Training & Internships

Cloud Services Training Program *Jul. 2025 – Sep. 2025*

National Telecommunications Institute (NTI), Cairo, Egypt | Score: 97%

- Built and deployed a 3-tier cloud architecture on AWS as part of the final training project, using EC2, S3, VPC, CloudFront, and IAM; containerized workloads with Docker within VMware-backed lab environments.
- Set up and configured Ubuntu Linux servers for application hosting; wrote Bash scripts to automate environment setup and service configuration as part of lab-based infrastructure tasks.

HCIA-Security Certification Training *Aug. 2025 – Sep. 2025*

National Telecommunications Institute (NTI) — Huawei Authorized Curriculum | Score: 97%

- Configured firewalls, VPN tunnels, and intrusion detection systems; applied network security policies and risk management frameworks across simulated enterprise environments.

DevOps Foundations*Jul. 2025 – Aug. 2025*

Sprints × Microsoft Summer Camp

- Practiced CI/CD workflows using Git and GitHub Actions; applied Continuous Integration, Continuous Delivery, service monitoring, and environment setup concepts within collaborative team sprints.

Backend Web Development — .NET [Secondary Specialization]*Oct. 2024 – Present*

Academic and Self-Directed Study

- Engineered RESTful Web APIs using C# and ASP.NET Core with MVC architecture, integrating SQL Server through Entity Framework Core ORM.
- Implemented cookie-based authentication with Claims Identity, role-based authorization, server-side model validation, and EF Core code-first migrations; worked with both SQL Server and MySQL as database backends.

CCNA — Routing, Switching & Network Security*Sep. 2024 – Jun. 2025*

Self-Study, Cisco Official Curriculum and Packet Tracer Labs

- Configured Cisco routers and switches via CLI; implemented OSPF, EIGRP, VLAN segmentation, ACLs, and subnetting across simulated enterprise network environments.

MCSA — Windows Server Administration*Sep. 2024 – Jun. 2025*

Self-Study, Microsoft Official Curriculum

- Administered Windows Server environments with Active Directory, Group Policy, DNS/DHCP, Hyper-V, and infrastructure hardening across lab-based enterprise projects.

Projects

Automated CI/CD Pipeline with Docker and GitHub Actions*Aug. 2025 – Sep. 2025*

Tools: Docker, GitHub Actions, Linux, AWS EC2, Bash Scripting, Git

- Built a CI/CD pipeline using GitHub Actions that automatically builds a Docker image on every push and deploys the containerized application to an AWS EC2 instance — a self-initiated project to apply DevOps concepts learned in training.
- Wrote multi-stage Dockerfiles to produce lean production images, eliminating environment inconsistencies between development and deployment stages.
- Configured GitHub Actions workflows with environment-based secrets management, rollback triggers on failed deployments, and deployment status notifications.
- Administered the target Ubuntu EC2 instance including environment setup, Docker runtime configuration, SSH key-based access, and security group hardening — all managed through the automated pipeline without manual intervention.

3-Tier Application Deployment on AWS*Jul. 2025 – Sep. 2025*

Technologies: AWS (EC2, S3, VPC, IAM, CloudFront), Docker, VMware

- Deployed a 3-tier application on AWS as the capstone project of the NTI Cloud Engineering program: Presentation Tier (CloudFront + S3), Application Tier (EC2 in a private subnet running the containerized app), and Data Tier (isolated private subnet with restricted access).
- Designed the VPC network architecture with public and private subnet segmentation, NAT gateway for outbound traffic, and security groups enforcing least-privilege access between each tier.
- Configured IAM roles per tier to ensure no tier has access beyond its responsibility; containerized the application layer using Docker for consistent and repeatable deployments across environments.

Clinic Management System — Backend Developer*Oct. 2024 – Jun. 2025*

Technologies: C#, ASP.NET Core MVC, Entity Framework Core, SQL Server | Collaborative Team Project — Role: Backend Development

- Responsible for the complete backend of a clinic management system built with ASP.NET Core MVC as a university team project; implemented four controllers — Account, Doctor, Patient, and Appointment — covering all core clinic operations.
- Built a custom cookie-based authentication system using Claims Identity with two distinct roles: Admin (full system access) and Doctor (restricted to their own appointments only) — enforced via ASP.NET Core Authorization attributes across all controllers.
- Built the database schema using EF Core code-first migrations (12 total); applied a unique composite index on (DoctorId, AppointmentDate) to prevent double-booking conflicts — an intentional design decision for data integrity.
- Implemented server-side model validation using Data Annotations across all entities, and seeded a default Admin user directly in OnModelCreating to ensure a ready-to-run system on first deployment.
